Abstract of DE10023602

The invention relates to a spherical sleeve joint (1). The inventive joint consists of a housing (2), a spherical sleeve (5) provided with a preferably spherical bearing surface (6) and a bearing shell (11) which is accommodated in a recess (10) of the housing (2) and encloses the bearing surface (6). According to the invention, the housing (1) consists of at least two parts (3,4). The parts (3,4) of the housing are respectively provided with corresponding elastic tooth elements (8,9) which engage with each other when the housing (2) is assembled. The inventive joint is configured in such a way that manufacturing requirements and the number of components making up said joint can be reduced, resulting in lower production costs.
